

CHART OF THE DAY

September 10, 2017

Spotlight on : 10-2 Yield Curve

A key metric to follow is the relationship, i.e., the spread, between the 10-Year U.S. Treasuries yield and the 2-Year U.S. Treasuries yield.

A widening spread denotes bullishness and economic growth expectations, while a declining spread that goes negative (or inverts) signifies slowing economic growth and, even, the likelihood of a recession.

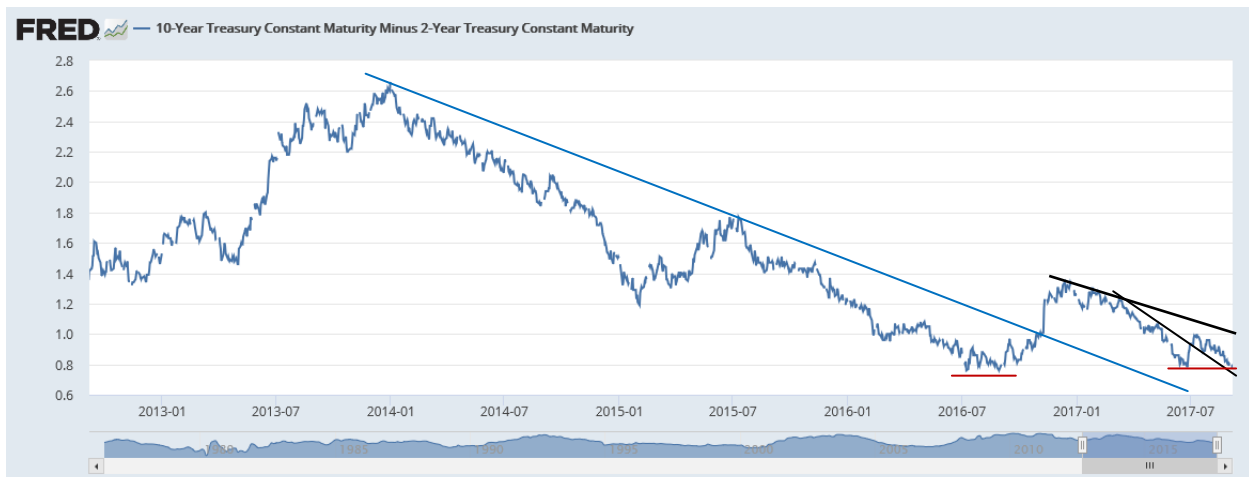

For clarity, a negative or inverted yield curve indicates that long-term debt instruments have a lower yield than short-term debt instruments, given that these debt instruments are of the same or similar credit quality.

Historically, inversions of the yield curve have preceded many U.S. recessions. Thus, the yield curve is considered an important barometer for predicting turning points in the business cycle.

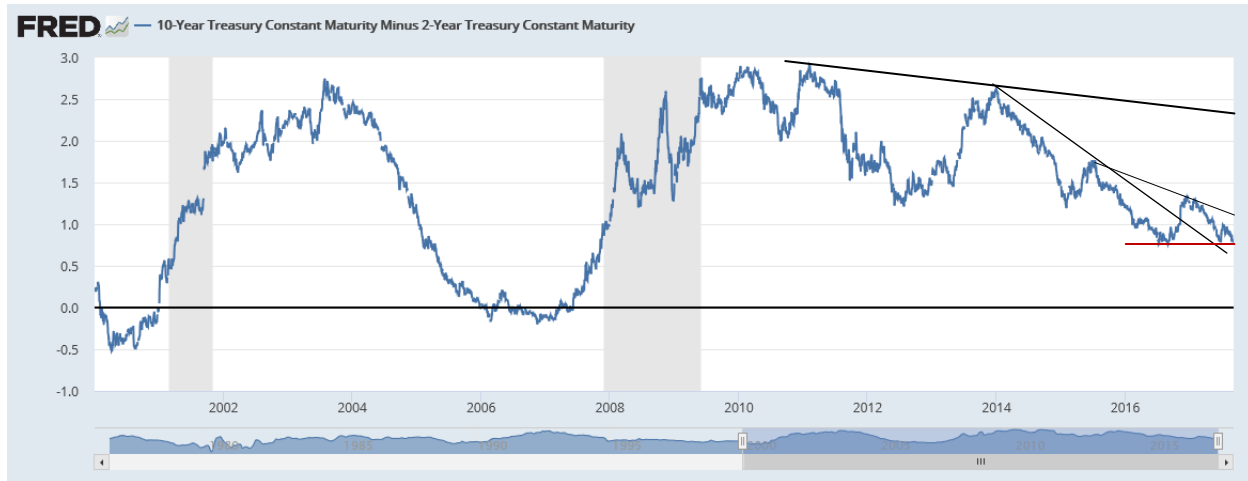

The current (Sept. 6) 10-2 yield curve reading is 0.80x, and falling. (It was 0.99x on July 10.)

This is nowhere near a recessionary reading of 0.00x. The trend is still down and is possibly ready to put in a quadruple bottom as it follows the (thin) secondary **black** down-trend line.

Here is a five-year chart (Sept. 2012-Sept. 2017). The **blue** longer-term down-trend is passé:

Here is a look at the 10-2 yield curve going back to January 2000. It shows the negative occurrences and the corresponding recessions that soon followed. Currently, there is no likelihood of a recession looming.

COMMENT: *Although the down-trend has resumed, a quadruple bottom may occur short-term. Even if the quad-bottom support does not hold, the 10-2 yield curve is still nowhere near the 0.00x level needed to denote a recession. With U.S. economic growth continuing positively, the possibility of a recession in the United States seems remote at this point.*
