TECHNICAL CHARTING OPINION

eResearch Corporation is pleased to feature a technical opinion by Chris Kimble of Kimble Charting Solutions.

Mr. Kimble states, on his website www.kimblechartingsolutions.com, that his goal for his investment research is to:

… help people to enlarge portfolios regardless of market direction by looking for patterns at extreme points of "exhaustion" with a high probability of reversing, called TBNM: tops, bottoms, no middles. The intent is to simplify the decision-making process.

Mr. Kimble has been in financial services for over 30 years.

His research is intended to simplify investment decisions and increase confidence with charts that are clear as to the pattern at hand and action to take. His strategy is to look for chart patterns at extreme exhaustion points that have a high probability of reversing. These extremes reflect excess fear and greed of global investors and, therefore, they can be capitalized upon.

By providing research showing markets at extremes of long term resistance or support, and including bullish/bearish sentiment readings when available, Mr. Kimble attempts to help investors simplify their decision-making, reduce risk, increase confidence, and improve results.

Today's article begins on the following page, and is entitled:
Another Dire Warning For Stocks? It Was, In 2000 & 2007

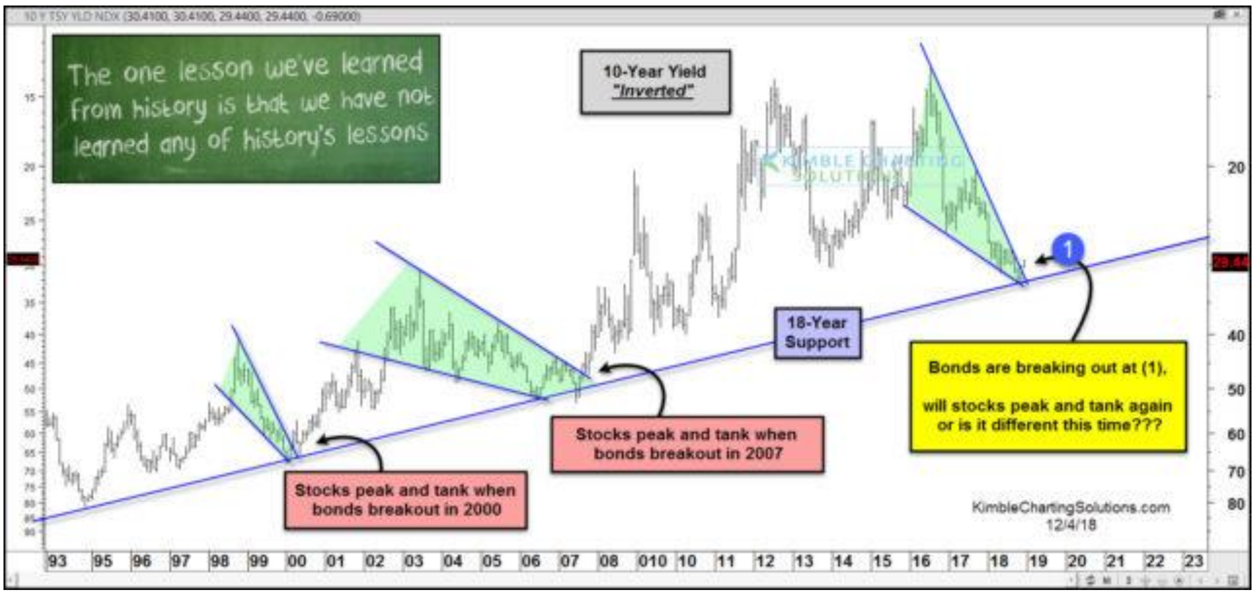
Another Dire Warning For Stocks? It Was, In 2000 & 2007

(To enlarge the chart below, place cursor on chart, and <Ctrl-Click>)



<CTRL-CLICK> ON CHART TO ENLARGE

Are stocks receiving another dire warning, similar to the message received in 2000 & 2007? Very possible!

This chart looks at the yield on the 10-year yield, inverted. This chart now resembles bond prices. The inverted yield has remained above a key support line for the past 25 years.

In 2000 & 2007, the inverted yield created a bullish falling wedge, with the apex of the wedge at 25-year rising support. When a break-out took place in 2000 & 2007, stocks were peaking and they soon tanked.

The inverted yield has been falling hard the past few years, bringing it back to test 25-year rising support. Over the past couple of years, the inverted yield looks to be forming another bullish falling wedge, with the apex of the pattern taking place at support.

This week it is making an attempt to break out from this bullish pattern at (1), similar to the price movement in 2000 & 2007!

In 2000 & 2007, when break-outs took place, stocks peaked and tanked in the months ahead.

Will it be different this time???
